

I spoke with both Arizona and Commercial Analysts to find out what their research about household smoking incidence to be.

Commercial Analysts' data show household incidence to be about 33%. Individuals smoking incidence is about 27%.

Arizona has incidence data from the 1983 and 1984 smoking studies. These data show household smoking incidence to be:

1983	35%
1984	33%

1985 - approximately 34% (a precise figure has yet to be calculated.)
